

Abstract:

In a shower nozzle of the present invention, a holding portion (1a) having a water flow passage communicating with a hot/cold water inlet formed therein and a water spraying portion (1b) having a plurality of water passing holes provided therein are connected to each other through an open/close valve (6) detachably disposed at one end portion of the holding portion (1a) or the water spraying portion (1b) to form a nozzle body (1c) and a push button (12) for performing the open/close operation of the open/close valve is detachably fitted to the other end of the water spraying portion (1b), whereby water can be jetted and stopped by merely pressing the push button from above in a state of the shower nozzle locked to a shower hook to increase an operability, and the shower nozzle can be easily converted into a type not having a water jetting and stopping function or a type having the water jetting and stopping function.
